How do you feel?

¿Cómo se siente?

Dear Parents,

The check-up exercise your child has completed on the other side of this letter is an activity derived from what we call "toothpick arithmetic." This is first introduced at the "manipulative" level - toothpicks are laid down to cross the horizontal lines given on the page. The number of crossing points then made by the sticks and lines is recorded below the sketch. The important condition is that when a certain number of horizontal lines is given, all must be crossed if any are crossed. A diagram like:  is not allowed.

With that set of rules, problem-solving activities develop which require lots of trial and error at first. When solving this kind of puzzle, the use of toothpicks that can be moved around without leaving painful reminders of 'errors' gives greater flexibility to the child. He is invited to experiment and to record just the correct solution. Please try some yourself and see how much mathematics and 'old-fashioned' drill you go over in your head while working them out.

$$6 + 2 = 8$$

Your child has moved to the representational level now, filling in lines to create the crossing points needed to solve these interesting mathematical puzzles. Later in the book these lines and crossing points sketches will be used to deal with multiplication and division.

We hope you can see that CDA books are concerned with clearly communicating the idea that arithmetic is not just arbitrary facts and rules to memorize and parrot back, but a common way of describing and writing down what we actually find out about the "real" world. An important goal is "friendliness with numbers."

Hopefully you are becoming more friendly with numbers right along with your child, and enjoying his or her growth in mathematics. With time taken for clarity and pleasure, that growth and understanding can be so much firmer and more rewarding.

Sincerely,

How do you feel?
¿Cómo se siente?

Dear Parents,

In completing the check-up exercise on the other side of this letter your child has successfully used the shorthand forms for "more than" and "less than", which are universal mathematical symbols. Before ever seeing these symbols your child certainly understood the "concept" of more and less (you've witnessed this often - "Hey, she got two more than I did!"), but now there is also a familiarity with the mathematical signs. The problems at the bottom of the page also required addition and subtraction problem-solving without any direct pictorial representation on the page. Some special praise for your young one!

As you may have already seen on previous pages coming home, your child has taken a major new step in learning to solve addition problems where "regrouping" (what we knew as "carrying") is necessary. This requires a solid understanding of the "place value" of numbers - of tens and ones in our decimal number system. We've approached this at the manipulative level with tensticks and loose beans - have you still got some handy?

Once your child can quickly show you 2 tensticks and 4 loose beans (instead of 24 loose beans) when you ask to "see" 24, then regrouping can be explored. We encourage you to go over some at home, using the tensticks and loose beans to "feel" along with your child what is actually happening in this process. You'll delight in the clarity of discovering the "concrete" relationship at a personal level too, we think!

You can lay out a problem with the tensticks and beans. Adding the ones (loose beans) first, when you get to ten, "trade" them for a tenstick, and mark that you now have one more ten in the tens column. Record in the ones column how many loose beans remain, and finally the total of tens.

Again we remind you to do such activities only when you and your child can both do so in a friendly, fun way. Please remember that pleasure and self-confidence assist in the learning process more than anything else. We can't thank you enough for your help!

Sincerely,

How do you feel?
¿Cómo se siente?

Dear Parents,

With this progress test you can see that your child can now compute problems where regrouping (discussed in the previous letter) is involved, not only in addition problems but also in subtraction. After first manipulating the operations with tensticks and beans, the move was made to the use of representations on the pages in the book. These pictures remain important referents - constant reminders that the numbers and signs are symbols of concrete things in the "real" world. We only bypass understanding and self-confidence in the learner if we don't allow for sufficient time at these manipulative and representational levels.

Since "sufficient" time varies with each individual learner, we encourage you to use sticks and beans (or pictures if your child is comfortable at that level) for as long as you feel the need when practicing at home. Once frustration and failure begin, chances for learning diminish quickly. So it's important to work at the level at which your child feels comfortable, moving on when he or she gives a clear sign of readiness.

For many children, regrouping in subtraction is more difficult than in addition. Your child has successfully done lots of it now, so you can ask what "happens" in this operation and go over it with tensticks and beans. If you need to help, here's how:

Working with the ones (loose beans) first, you haven't enough to take 7 away. So you'll need to trade one tenstick for 10 loose beans. Mark in the tens column that you now have one less ten and in the ones column mark that you have ten more ones. Now complete the subtraction - first with the ones, then the tens.

Thank you again for all your support and encouragement!

Sincerely,

A.

How do you feel?
¿Cómo se siente?

Dear Parents,

This progress test shows you that your child can now work with addition and subtraction problems that require regrouping into the hundreds. There are pictures of the "place value" groupings on the test, as on the previous pages of this kind. The abstract idea of a hundred develops only with lots of exposure to the manipulation of a hundred things, and then to pictorial representations.

If you made some beanstick hundreds rafts as suggested in the B₁ book, you can use them here for manipulating the new step in the regrouping process that your child is now working with. Talk about

hundreds and tens is abstract talk, whereas working with hundreds rafts and tensticks is very "real" to the touch and sight. After using these, blocks of hundreds and tens drawn on paper are very "real" to see, and the knowledge is there that they refer to those concrete things (such as beans) that we know and have worked with.

In solving the problems on this check-up test, your child had to work with the idea that 10 tens is exactly the same as a hundred. Then the "trades" - regrouping a hundred from 10 tens and regrouping 10 tens from a hundred be made. This is sophisticated and the kind we use daily in our It may take your child much more of activities with confidence, so please encourage the use of counters and pictures as long as necessary. A positive attitude toward mathematics as a logical method of recording what we see and use in the real world is what is most important.

$\begin{array}{r} \overset{11}{} \\ 182 \\ + 28 \\ \hline 210 \end{array}$	had to mathe- adult	$\begin{array}{r} \overset{11}{} \\ 227 \\ - 147 \\ \hline 80 \end{array}$	and matics lives. time to work these kinds
--	---------------------------	--	---

Again we remind ourselves and you that your child's attitude about math and about himself as a participant in the activities of math are the decisive factors in what is learned. Once again your warm support is welcomed and well appreciated.

Sincerely,

Please draw your own lines and crossing points.

How do you feel?
¿Cómo se siente?

Dear Parents,

Your child has been doing lots of multiplication and division activities and on this check-up exercise has recorded those processes in the standard notation forms - some without any picture to refer to. It's important to mention here, as was mentioned in the A_2 level book, that all children understand the "concepts" of multiplication and division before they come to school. They've seen that when 3 children each have 2 toys there are 6 toys, that 2 groups of 5 fingers are 10 fingers, and they've shared 8 cookies amongst 4 friends. Now they are learning to record this knowledge in the special shorthand of arithmetic.

The "lines and crossing points" sketches here are an interesting and very workable way of representing the operations of multiplication and division. There is nothing scary or mysterious about those big words they've heard. There are 4 crossing points in each of 3 rows ($4 \times 3 = 12$) just as 4 children with 3 cookies each results in 12 cookies. Math is reasonable!

You can help with this at home by simply discussing everyday sorts of examples and perhaps writing some down in the standard forms your child is learning. You can come up with lots of fun ideas - i.e. there are 4 people sitting at the table, each person has 2 hands, so how many hands are there at the table; each person has 3 pieces of silverware, so how many pieces are there on the table; there are a dozen cookies in the package, so what's each person's share, etc.

Pleasure and self-confidence can and should be high for your child now. Let's work to keep it that way with lots of enthusiastic and fun support!

Sincerely,

How do you feel?

¿Cómo se siente?

Dear Parents,

The check-up test on the other side of this last letter in the B-level computation books shows the great development in computational skills that your child has now made! To add a series of three 2-digit numbers your child has had to compute lots of addition and "regrouping", as has been discussed in previous letters.

Please notice that the representational sketches are still available on the page and still serve as most important reminders of what all that mathematical shorthand refers to. Even for the child who does not feel the need to use the pictures for the actual problem-solving, they serve as a valuable way to "self-check" the answer arrived at - just count (using the shortcut of "counting-on" from 10's, of course!) and see if you come up with the same number. Tensticks and beans can also be used as a self-check device. And again we encourage you to suggest to your child to use those "manipulative" devices whenever frustration or serious hesitation is occurring.

We can't repeat often enough that your child's attitude about math and about himself or herself as a competent learner are of the most vital importance. When a child feels good about numbers, confident about using them, comfortable talking about them, then that child will do well in mathematics - in the everyday use of numbers and on progress tests.

Your careful support and encouragement in helping us deal with numbers in a "friendly" way is greatly appreciated. We hope you have been able to detect the growth in the understanding of mathematical relationships that has been happening and will continue to happen for your child - with lots more fun and exciting discoveries along the way!

Sincerely,
